

ReactJS 30-Minute Task Financial Dashboard Component Challenge

Scenario

Youve just joined our front-end team as a **React Developer**. Your manager drops a quick message:

Hey I need a quick **Financial Dashboard summary component** built in React before our next sprint review. Youve got **30 minutes**. Just a simple component-based UI mock-up, no backend. Use this Figma reference for design inspiration: <https://uxpilot.ai/s/b6552181029c347e25b9b8f5c13f5e36> Show me you understand React fundamentals components, props, state, conditional rendering, and data mapping. Dont overengineer it I just want to see clean, modular, React code.

Task Overview

Goal: Build a **Financial Summary Dashboard** React component that mimics the structure and layout from the reference design. You dont need to match the exact styling focus on the React logic, reusability, and component organization.

You are expected to design this as a **modular UI built with React functional components** (no CSS frameworks, no backend calls).

What You Need to Build (Functional Breakdown)

Youll create **four key components**:

1. HeaderComponent.jsx

- **Displays:**
 - Project Name: `Project: Downtown Office Complex`
 - Two buttons: `View Budget & BOQ` and `Generate Financial Report`

2. SummaryCards.jsx

- Four small cards showing:
 - Total Project Budget `$2.5M`
 - Total Actual Spend `$1.8M`
 - Budget Remaining `$700K`
 - Budget Variance `+5.2% (Under Budget)`

- Each card should be a reusable `<SummaryCard>` component accepting props: `title`, `value`, and optionally `subtext`.

3. FinancialActivity.jsx

- A section titled Recent Financial Activity.
- Render a **list of 45 activity items** (use hardcoded JSON array).
- Each list item should display:
 - Activity Title (e.g., Invoice INV-2025-001 Approved)
 - Description (e.g., Materials supply \$45,000)
 - Relative timestamp (e.g., 2 hours ago)
- Implement a **filter bar** at the top to filter by keyword (Invoice, PO, etc.). *Hint: Use React state + input field + onChange filter.*

4. SpendingByCategory.jsx

- A table showing:
 - Category | Budgeted | Actual Spend | Variance | % Spent | Status
- Data should be read from a static JSON array.
- Render dynamically with `.map()`.
- Apply conditional styling or icon for Status (On Track or At Risk).

Example Data Structures

```
// Recent Financial Activity
const activities = [
  { id: 1, title: "Invoice INV-2025-001 Approved", desc: "Materials supply $45,000",
  { id: 2, title: "PO-2025-045 Issued", desc: "Electrical equipment $12,500", time:
  { id: 3, title: "Payment for GRN-2025-023 Processed", desc: "Concrete delivery $8,
  { id: 4, title: "Invoice INV-2025-002 Pending", desc: "Labor costs $22,000", time:
];
```

```
// Spending by Category
const spending = [
  { category: "Materials", budgeted: 800000, actual: 720000, variance: "+80,000", per
  { category: "Labor", budgeted: 900000, actual: 750000, variance: "+150,000", percen
  { category: "Subcontractors", budgeted: 600000, actual: 280000, variance: "+320,000
  { category: "Equipment", budgeted: 200000, actual: 50000, variance: "+150,000", per
];
```

Time Constraint (30 Minutes)

Here's a practical time plan you can follow:

Task	Expected Time
Setup React environment (Vite or CRA)	5 mins
Create reusable <code>SummaryCard</code> & dummy data	5 mins
Build the Financial Activity component (filter + list)	10 mins
Render the Spending table (map + conditional styling)	8 mins
Quick cleanup and README note	2 mins

Evaluation Criteria (Total 100 Marks)

Parameter	Description	Marks
1. Component Structure	Proper use of reusable, prop-driven components	25
2. React Logic & State	Correct usage of <code>useState</code> , <code>map</code> , and conditional rendering	25
3. Clean Code	Readability, meaningful naming, DRY code	20
4. UI Consistency	Visual hierarchy similar to Figma (flex/grid OK)	15
5. Interactivity	Filter functionality and correct table rendering	15

Submission Guidelines

1. The submission must be a **public GitHub repository link** that is **open and accessible to anyone**.
2. Reply to **this same email thread only** with **just the public GitHub link** no attachments, no additional comments, no Google Drive or zip files.
3. Submissions through any other means (private links, attachments, etc.) **will not be accepted**.
4. Once you receive this task, please reply **immediately** to confirm **when you plan to revert with your GitHub submission**. This helps us schedule your evaluation.

Bonus (Not Required but Nice to See)

- Reusable Card and TableRow components.
- Minimal hover/active effects for buttons.
- Light/dark mode toggle (if you finish early).

How the Evaluator Scores It

Checklist	Pass/Fail
Uses modular components (<SummaryCard>, <FinancialActivity>, etc.) Filters financial activities dynamically Renders spending data dynamically from array UI roughly matches layout (Header → Summary → Chart → Activity → Table) Code readable and logically separated	

Summary

This task doesn't test how beautiful your dashboard looks it tests whether you **think like a React developer**:

- Can you break a design into reusable, prop-based components?
- Can you manage simple state and render conditionally?
- Can you write clean, readable, modular code in under 30 minutes?
